

AZ-900 Mini Project Report

Creating a Web App in Azure

Objective

This mini lab focuses on creating a basic Web App using Azure App Service. It demonstrates how to provision and deploy a scalable web hosting environment directly from the Azure portal.

Steps Performed

Step 1: Access App Services

Log in to the Azure Portal (<https://portal.azure.com>). In the search bar or home dashboard, locate and click on 'App Services'. Then, select the 'Web App' option to begin creating your web application.

Step 2: Create Web App

Click on the 'Create' button under App Services. This opens a multi-tab wizard to configure your web app settings.

Step 3: Configure Basics

- Selected existing or created new Resource Group.
- Gave the Web App a unique name.
- Chose runtime stack (e.g., .NET, Node.js) depending on the intended platform.

- Home > App Services >
Create Web App ...

Step 4: Review and Create

Step 5: Accessing the Web App

Once deployed, clicked on the web app URL provided in the resource overview to launch it in the browser. Verified that the default web app landing page loaded successfully, confirming deployment.

What I Learned

- How to deploy a scalable web app using Azure App Services.
- The relationship between resource groups, service plans, and web apps.
- Importance of region selection and unique naming in Azure.
- Quick deployment of live web environments using pre-built configurations.

Customization

This web app can be further customized by integrating with Visual Studio or Visual Studio Code. Developers can push their own HTML/CSS/JavaScript or backend code, set deployment pipelines, and configure custom domains, authentication, and scaling features as needed.
